

Team reflection sprint 2 week 16

Customer Value and Scope

We are still working for Elicit to create an application to reserve workspaces in offices. This is a desirable condition and we intend to keep it by providing value for them.

Our top priority is still to create a fully functional MVP with all the functionality demanded by Elicit. We will achieve this by continuously discussing our progress with Elicit in order to get their feedback.

Social Contract and Effort

There have been no changes in the social contract. Although, the team should look back on the previous sprints in order to make sure the contract has been followed.

Design decisions and product structure

The design decisions that we have made/are making are based on client feedback. This sprint (sprint 2), we have had two meetings with our client in order to get a better understanding for our client's needs. The goal is to have a meeting with our client every Friday, i.e. the last day of every sprint so that we can continuously discuss the team's design decisions.

The client currently uses Azure for their organization. Therefore they requested that we use Azure Active Directory for authentication. Previously we planned on using Firebase Authentication which supports the use of SSO via Azure AD. Since we use Flutter and Firebase, which is owned by Google and Azure is owned by Microsoft, there were some compatibility issues. We, therefore, decided to use Azure AD separate from Firebase to ensure the user can use Azure as requested.

The client wants to be able to change companies and the offices related to them. A logo and name should represent each one.

Application of Scrum

- Hugo Dahlgren is de facto product owner.
- Ole was scrum master this week, he learned a lot.
- Ole is chosen as scrum master for next week as well. As a part of the role he should set up some general routine for scrum.
- Pelle from Elicit is the client.
